

## ABSTRACT OF THE DISCLOSURE

An image forming system which performs communication among a plurality of devices comprises a communication control device, which is communicably connected to each of an image forming device, a computer, and a print control device, is arranged, and communication among these devices is performed through the communication control device. Therefore, commands transmitted from these devices are received by the communication control device. In the communication control device, when a command transmitted from any one of these devices is received, a transmission destination is automatically selected from the devices except a transmission source of the received command based on relation information, so that the command is transmitted to the device of the selected transmission destination.
